MediMesh: Presentation Script

Design Round | Problem Statement 38 | Team Pixel Minds | About 7 minutes

Tip: shaded box mein jo likha hai wo bolna hai. Slide se padhna nahi, apne words mein bolna.

Slide 1: Title (20 sec)

"Good morning judges. Hum **Pixel Minds** hain, aur humara project hai **MediMesh**: local pharmacies ka ek virtual warehouse. Humara domain Software & Web Development hai."

Yahan rukna mat, seedha problem pe jao.

Slide 2: Problem Statement (30 sec)

"Humara problem statement 38 hai. Do dikkatein hain: pehli, customer ko apni preferred pharmacy mein dawai nahi milti. Doosri, pharmacies ke paas limited stock hota hai aur unhe incoming requests efficiently manage karni hoti hain. Humara focus ek line mein: **medicine access jo stock kam hone par bhi fail na ho.**"

Statement slide se mat padho, bas dono dikkatein bolo.

Slide 3: Understanding the Problem (1 min)

- **Who is affected:** "Patients aur caregivers, khaaskar urgent aur chronic dawai wale. Doosri taraf local chemists, jinke paas limited stock hota hai."
- **What is going wrong:** "Preferred pharmacy mein stock nahi, to customer shop-to-shop call karta ya jaata hai. Chemist ke paas koi system nahi, to ya wo sale khota hai ya same stock do logo ko promise kar deta hai, yaani oversell."
- **Why it matters:** "Dawai mein deri ka matlab treatment mein deri. Chemist ke liye lost sales aur expire hone wala dead stock. Aur aaj realtime cloud tools sasta aur easy hain, isliye ye network ab banana possible hai."

Slide 4: Proposed Solution (1.5 min)

Blue box: "Hum customers ko medicine dilate hain, nearby pharmacies mein request route karke, stock-safe reservation ke saath, shop-to-shop search ki jagah."

- **Step 1, Input:** "Customer sirf dawai aur quantity daalta hai, jaise Paracetamol, 10 strips."
- **Step 2, Process:** "System request nearby pharmacies ko bhejta hai, jis pharmacy ke paas stock hai wahan stock **soft-lock** karta hai, aur agar preferred pharmacy ke paas nahi hai to peer pharmacy se borrow karta hai."
- **Step 3, Outcome:** "Customer ko live status dikhta hai, aur dawai usi counter pe ready milti hai."
- Soft-lock ek line mein: "Jaise BookMyShow mein seat lock hoti hai, waise stock 30 minute ke liye hold hota hai."

Slide 5: Key Features (1 min)

- **Soft-lock Reservation:** "Do customers last strips pe clash nahi karte, oversell khatam."
- **Smart Matching:** "Nearby pharmacies ko score karke top 3 ko pehle request jaati hai, isliye request kam fail hoti hai."
- **Auto-Borrow & Ledger:** "Stock peer pharmacy se aata hai, aur settlement ledger mein automatically record hota hai."
- **Split Fulfilment:** "Quantity zyada ho to do pharmacies se split ya partial fulfil, ye quantity-exceeds-stock edge case solve karta hai."
- **Live Status Tracking:** "Requested, Sourcing, Confirmed, Ready: customer aur pharmacy dono ko live dikhta hai."
- **Lost Sales Meter:** "Chemist ko dikhata hai ki stockout se kitni sale gayi aur kab low stock alert chahiye. Ye pharmacy ke liye paying reason banta hai."

Judges ke checklist ke teeno edge cases yahan cover ho gaye, ye line zaroor bolna.

Slide 6: Architecture & Tech Stack (1 min)

- **User layer:** "Customer app, pharmacy dashboard aur live map."
- **Application layer:** "Matching, soft-lock aur borrow logic, Next.js API routes aur Postgres functions mein, taaki lock aur stock deduction ek atomic transaction mein ho."
- **Data layer:** "Supabase Postgres mein inventory, requests aur ledger. Supabase Realtime se status live update hota hai."
- Right side stack: "Figma se design, Next.js + Tailwind frontend, Leaflet map. Sab free-tier tools hain, isliye ye 24 ghante mein build ho sakta hai."

Slide 7: Innovation & Differentiation (1 min)

- **Ease of use:** "Abhi customer shop-by-shop check karta hai, hamare yahan ek request mein system dhundta aur reserve karta hai."
- **Cost / access:** "Zyada solutions chain-focused hain, hum local chemists ke liye hain, chhote per-order fee ke saath."
- **Personalization:** "Customer ki preferred pharmacy bani rehti hai, aur urgent cases ko priority milti hai."
- **Scalability:** "Network effect: jitni zyada pharmacies judti hain, utne kam stockouts."

Orange line (thoda ruk ke bolo): "Humara unique edge: **peer-to-peer stock borrowing**, jisse koi request fail nahi hoti."

Slide 8: Impact, Feasibility & Risks (1 min)

- **Impact:** "Customer multi-shop hunt se bachta hai, chemist ki lost sales recover hoti hain."
- **Feasibility:** "Next.js + Supabase pe core flow 24 ghante mein buildable hai, hum search se status tracking tak working demo dikhayenge."
- **Scalability:** "Locality by locality, ek area se shuru karke aage badhenge."
- **Risks:** "Sabse bada risk prescription dawai aur logistics hai. Prescription-only dawai pharmacist verification ke baad hi aage badhegi, aur hum pehle ek locality mein pilot karenge."

Risk khud bolna credibility badhata hai, chhupana nahi.

Closing (10 sec)

"Hum dawai **dhundhne** ko nahi, dawai **milne** ko solve karte hain. Thank you, hum questions ke liye ready hain."

Q&A ke liye tayyar jawab

Sawal	Jawab
Runner/delivery real mein kaise hogi?	Demo mein status simulated hai. Real mein local delivery partners ya pharmacy-to-pharmacy runner, pilot ek locality se.
Substitute galat de diya to?	Sirf suggestion hai, pharmacist approval ke baad hi, UI mein disclaimer.
Chemist kyun judega?	Lost Sales Meter rupees mein dikhata hai ki kitna nuksaan ho raha hai, aur extra sales milti hain.
1mg ya PharmEasy se kya alag hai?	Wo delivery aur e-commerce hain. Hum local chemists ke beech ek inventory-sharing network hain.

Practice tip: 8 slides ke liye lagbhag 7 minute banta hai. 2-3 baar timer lagake bolo, aur slide 4 aur 7 pe sabse zyada zor do, kyunki wahi tumhara idea aur edge hai.
